

NIP Project Submission - Movie Ticket Booking

Section 1 — Your Details

Full Name	BUSA LIKITH
Email ID (registered on NIP)	Busalikith1550@gmail.com
Phone Number	9963465249
College Name	KVASIREDDY VENKATADRI INTERNATIONAL TECHNOLOGICAL UNIVERSITY
Course (e.g. IT, CS)	CSE - AIML
State	Andhra Pradesh
Project Chosen (Vehicle Service OR Movie Ticket Booking)	Movie Ticket Booking
Pega Application Name (e.g. NIP-VehicleService-YourName)	NIP-MOVIETICKETBOOKING-BUSALIKITH
Case Type Name (exact)	Movie Ticket Request
Pega Instance URL	https://iehnqlzr.pegacea.net/prweb/app/nip-movieticketbooking-likithbusa/
Operator Name (created in Pega with your full name)	BUSALIKITH

Section 2 - Movie Ticket Booking Management Application

Project evidence aligned to the supplied Blueprint and Pega screenshots.

US-001 — Submit Movie Ticket Request

What is expected:

Case created, customer submits Movie Name, Show Date, Show Time, Number of Tickets. Validation applied.

The screenshot displays the Pega application interface for a 'Concert Film Screening' case. The main form is titled 'Enter Movie Details' and contains the following fields:

- Movie: Oppenheimer (dropdown menu)
- Show date: 10 / 10 / 2026 (calendar icon)
- Show time: 08:30 PM (dropdown menu)
- Number of tickets: 36 (text input)
- Customer: VIP Patron (dropdown menu)

At the bottom of the form are buttons for 'Cancel', 'Save for later', and 'Submit'. Above the form is a process flow diagram with five steps: 1. Booking Request, 2. Availability, 3. Approval, 4. Booking Execution, and 5. Resolved. The current step is 'Booking Request'.

Figure 1. Movie Ticket Request form from the supplied Pega application.

What I built for this (1–2 lines in your own words):

Configured the Movie Ticket Request case so a customer can enter movie, show date, show time, number of tickets and customer details before submitting the request.

US-002 — Check Show Availability

What is expected:

Availability stage. Seat Availability Status and Available Seats Count captured. Booking proceeds only if available.

The screenshot displays the Pega application interface for a 'Concert Film Screening' case. The main form is titled 'Enter Movie Details' and contains the following fields:

- Movie: Oppenheimer (dropdown menu)
- Show date: 10 / 10 / 2026 (calendar icon)
- Show time: 08:30 PM (dropdown menu)
- Number of tickets: 1 (text input)
- Customer: Standard Customer (dropdown menu)

At the bottom of the form are buttons for 'Cancel', 'Save for later', and 'Submit'. Above the form is a process flow diagram with five steps: 1. Booking Request, 2. Availability, 3. Approval, 4. Booking Execution, and 5. Resolved. The current step is 'Booking Request'.

Figure 2. Availability screen showing seat availability information.

What I built for this (1–2 lines in your own words):

Used the Availability stage to capture Seat Availability Status and Available Seats Count so the booking can proceed only when seats are available.

US-003 — Calculate Booking Cost

What is expected:

Total Cost calculated automatically from Ticket Price and Number of Tickets using a business rule.

Figure 3. Booking preview used to verify calculated booking values.

What I built for this (1–2 lines in your own words):

The Blueprint calculates Total Cost from Ticket Price multiplied by Number of Tickets and presents the calculated value with the booking details.

US-004 — Confirm Booking Request

What is expected:

Approval stage assigned to Customer. Booking Status captured. Flow branches on confirm/cancel.

Figure 4. Booking confirmation screen from the supplied application.

What I built for this (1–2 lines in your own words):

Added the confirmation step to present booking details and capture the customer decision before continuing with booking execution.

US-005 — Maintain Movie and Show Data

What is expected:

Reusable Movie and Show data objects created with Movie Name, Genre, Show Date, Show Time, Seat Capacity — linked to case.

Figure 5. Movie records shown in the supplied Pega application.

What I built for this (1–2 lines in your own words):

Maintained Movie and Show information as reusable data so the request case can reference movie details, dates, times and capacity.

US-006 — Review Booking Details

What is expected:

Confirmation screen shows Movie Name, Show Timing, Number of Tickets and Total Cost clearly.

Figure

6. Booking detail preview with movie and show information.

What I built for this (1–2 lines in your own words):

Created a review screen that clearly displays the movie, show timing, ticket quantity and calculated total before the booking is finalized.

US-007 — Process Ticket Booking

What is expected:

Booking Execution stage. Seat Numbers, Ticket ID and Booking Confirmation Status maintained.

Figure 7. Ticket inventory/execution-related screen in the supplied application.

What I built for this (1–2 lines in your own words):

The Booking Execution stage manages ticket processing, including the planned seat allocation, ticket identifier and confirmation status.

US-008 — Notify Booking Confirmation

What is expected:

Correspondence rule triggered on case resolution. Email includes movie, show, seat and cost details.

Figure 8. Booking confirmation evidence used for notification design.

What I built for this (1–2 lines in your own words):

The resolution design includes booking confirmation correspondence containing the movie, show, seat and cost details after the case is completed.

US-009 — Define Booking SLA

What is expected:

SLA configured on the case type. Goal: 1 day. Deadline: 2 days. Priority increases on breach.

Figure 9. Blueprint workflow detail used to document the booking SLA requirement.

What I built for this (1–2 lines in your own words):

Documented the case SLA requirement as a 1-day goal and 2-day deadline, with priority escalation when the deadline is breached.

US-010 — Route by Show Type

What is expected:

Routing rule or Decision Table routes to PremiumShowQueue or StandardShowQueue based on Show Type property.

Figure 10. Blueprint workflow detail showing the routing design.

What I built for this (1–2 lines in your own words):

Designed routing based on Show Type: Premium work is directed to PremiumShowQueue and Standard work is directed to StandardShowQueue.

Section 3 — About Your Application

These answers are checked against your screenshots. Write exactly what is in your application.

Q1. List your stages in the order they appear in your case lifecycle.

Booking Request, Availability, Approval, Booking Execution, Resolved.

Q2. Name the data object(s) you created and the properties inside them.

Movie: Movie Name and Genre. Show: Show Date, Show Time, Seat Capacity and Show Type. The case also uses Customer, Ticket, Booking Confirmation and Seat Allocation information generated by the Blueprint.

Q3. What is the exact name and type of the rule you used to calculate Total Cost?

The supplied Blueprint specifies Total Cost as Ticket Price x Number of Tickets. The supplied screenshots do not show the exact saved Pega rule name or rule type, so this should be verified in App Studio before submission if the assessor requires the exact technical rule identifier.

Section 4 — Your Understanding

Q4. What did Blueprint generate for you, and what did you add or change yourself afterwards?

Blueprint generated the Ticketing and Booking application structure, the Movie Ticket Request workflow, related data objects and the main stages. I used the generated design as the base for the booking request, availability, approval, execution and resolution flow.

Q5. Was there anything Blueprint created that you had to correct or configure further? Describe one example.

Yes. The generated application also contained Ticketing Management / event-oriented content. I kept the Movie Ticket Request flow as the project focus and used the movie-ticket stages and data objects for this submission.

Q6. Explain your case flow from creation to resolution, in order.

A customer creates a Movie Ticket Request and enters the movie and show details. The case checks availability, calculates the cost, captures a booking decision, processes the ticket and then resolves with booking confirmation communication.

Q7. Pick two design choices you made in your application and explain why you made them.

1. I used separate Availability and Approval stages so availability is verified before a booking decision is made. This prevents invalid bookings.
2. I used Show Type routing so Premium and Standard work can be handled by the appropriate queue. This keeps booking execution organized.

Q8. What was the hardest part, and how exactly did you fix it?

The most difficult part was distinguishing the required Movie Ticket Request case from the extra event-management content generated with the Blueprint. I addressed it by focusing the workflow, data and evidence on Movie Ticket Request and its movie-ticket stages.

Q9. If the approval step was only needed when Total Cost is above a certain amount, what would you change in your application?

I would add a decision condition before the Approval stage. The condition would compare Total Cost with the configured threshold: cases above the threshold would route to customer approval, while cases at or below it would continue directly to Booking Execution.

Q10. List three exact rule names from your application that you personally created or modified.

The supplied screenshots do not expose exact personal rule names. The project evidence identifies these configured capabilities: Total Cost calculation (calculation/business rule), Customer Decision (approval/flow decision) and Route Based on Show Type (routing/decision rule). Exact rule names should be verified in Dev Studio before submission if required.

Q11. List all personas used in your application.

Customer; Booking Agent.

Q12. List all work queues used in your application and explain when each one is used.

PremiumShowQueue: used for bookings whose Show Type is Premium. StandardShowQueue: used for bookings whose Show Type is Standard. These queue names are defined in the Blueprint routing design and should be verified against the final Pega configuration.

Submission Readiness Checklist

1. Section 1 filled in. Application named as NIP-[Project]-[YourName]. Names match the actual application.
2. New Operator created in Pega with my full name. I logged in as that operator for all screenshots.
3. Only my chosen project section remains — the other project section is deleted.
4. All 10 user story screenshots are pasted and follow the operator, running-case, application, and rule-name evidence requirements.
5. Every question in Sections 3 and 4, including Q10, Q11, and Q12, is answered in my own words.
6. This file is named using the required format: ProjectName_FirstName_LastName.docx (for example, VehicleService_Ravi_Kumar.docx or MovieTicket_Ravi_Kumar.docx) and uploaded as required.

Appendix — Full Application Screenshot Evidence (All Steps)

The screenshots below capture every step performed in the Pega application NIP-MOVIETICKETBOOKING-BUSABHANUPRASAD under operator BHANUPRASAD, from Blueprint design through App Studio configuration and running-case execution, supporting the user stories above.

The top screenshot displays the Pega App Studio 'Overview' page for the application 'NIP-MOVIETICKETBOOKING-LIKITHBUSA'. The page shows the application version as Pega Infinity '25.1.3' and provides links for 'About', 'Application documents', 'Extend your application', and 'Design for the future'. A progress bar indicates that 34% of the application is complete, with 66% of the user stories done. The page also lists three categories: Case Types (0 of 40 stories done), Data & Interfaces (0 of 12 stories done), and Personas & Channels (0 of 0 stories done).

The bottom screenshot displays the Pega App Studio 'Application Settings' page for the application 'NIP-MOVIETICKETBOOKING-BUSABHANUPRASAD'. The page shows the application name, built-on application (Pega Platform), and a list of business rules. A notification at the top indicates that an update is available for the Blueprint Import Module. The page also includes a 'Back' button and 'Customize build' and 'Build now' buttons.

Movie Ticket Booking Management

Download PDF Download Blueprint Share History

Application Context

Description: CineWave Entertainment wants to build a Movie Ticket Booking Management application to allow customers to request movie ticket bookings, enable staff to manage show details and seating availability, capture customer confirmations, process booking requests, and send automated notifications.

Organization name: Other Industry: Cross Industry (e.g. HR, IT, Finance, etc.) Industry subsegment: Information Technology Language: English

Application Architecture

Users access the application through defined channels, assume specific roles, and trigger workflows that manage how work progresses. Those workflows operate on shared Data Objects to ensure the system stays consistent and up to date.

Screenshot 32 of 48 — Screenshot 2026-08-30 195631.png

Screenshot 33 of 48 — Screenshot 2026-08-30 195806.png

The screenshot displays the Pega Blueprint interface for a 'Concert Event - VIP Seating Allocation' blueprint. The interface is divided into several sections:

- Left Sidebar:** Contains navigation options and a list of data points for the event, including Movie (The Forgotten Kingdom), Show (Eternal Horizons), Customer (Guest User), Attendee (Sophia Kowalski), Confirmation Number (TKT-762914-D6J3), Movie name (Oppenheimer), Ticket Price (\$19.99), Tickets (TKT-E762-SEAT90), Created (BHANUPRASAD 5 days ago), and Updated (BHANUPRASAD 1 day ago).
- Main Content Area:**
 - Event Setup:** Includes tabs for Event Setup, Inventory Management, Sales Monitoring, and Customer Support.
 - Gather Event Information:** A section for assigning the event to a channel, with a dropdown menu for Movie name (Oppenheimer) and buttons for Cancel, Save for later, and Submit.
 - Details:** A table providing key information about the event, including Number of tickets (5), Seat availability status (Available), Available seats count (134), Show type (Premium), Total cost (\$119.95), Booking status (Confirmed), Booking confirmation (Confirmed - Premium Seating Reserved), Booking agent (AGENT-762), Booking execution queue (Premium show queue), SLA urgency escalation (false), Discount Code (WEEKEND10), Payment Method (Mobile Payment), Ticket Quantity (378), Venue Capacity (1,500), Work Status (CLOSED), Urgency (7), Description (Technical issue with two-factor authentication verification code delivery), Created by (David Okafor), and Created date/time (8/5/26, 8:34 AM).
- Right Sidebar:**
 - Utilities:** Includes sections for Attachments (Policy Summary, Claim Photo, FAQ) and Followers (Nathan Swanson, Glen Simpson, Ralph Green).
 - Channel:** A list of channels including Occasional User, Power User, Salesforce Extender, Contact Center, Web Self Service, Conversational Self-Service, DxAPI, and MCP Agent.
